

# Illuminating the Dark Genome to enable drug discovery from human genetics

James Heward • James Smith • Lauren Owers • Brigid Davidson • Anna James-Bott • Emmanouela Repapi • Arnulf Hertweck • Basel Abu-Jamous • Stephen Harrison

## Introduction Nucleome platform unlocks human genetics for drug-discovery

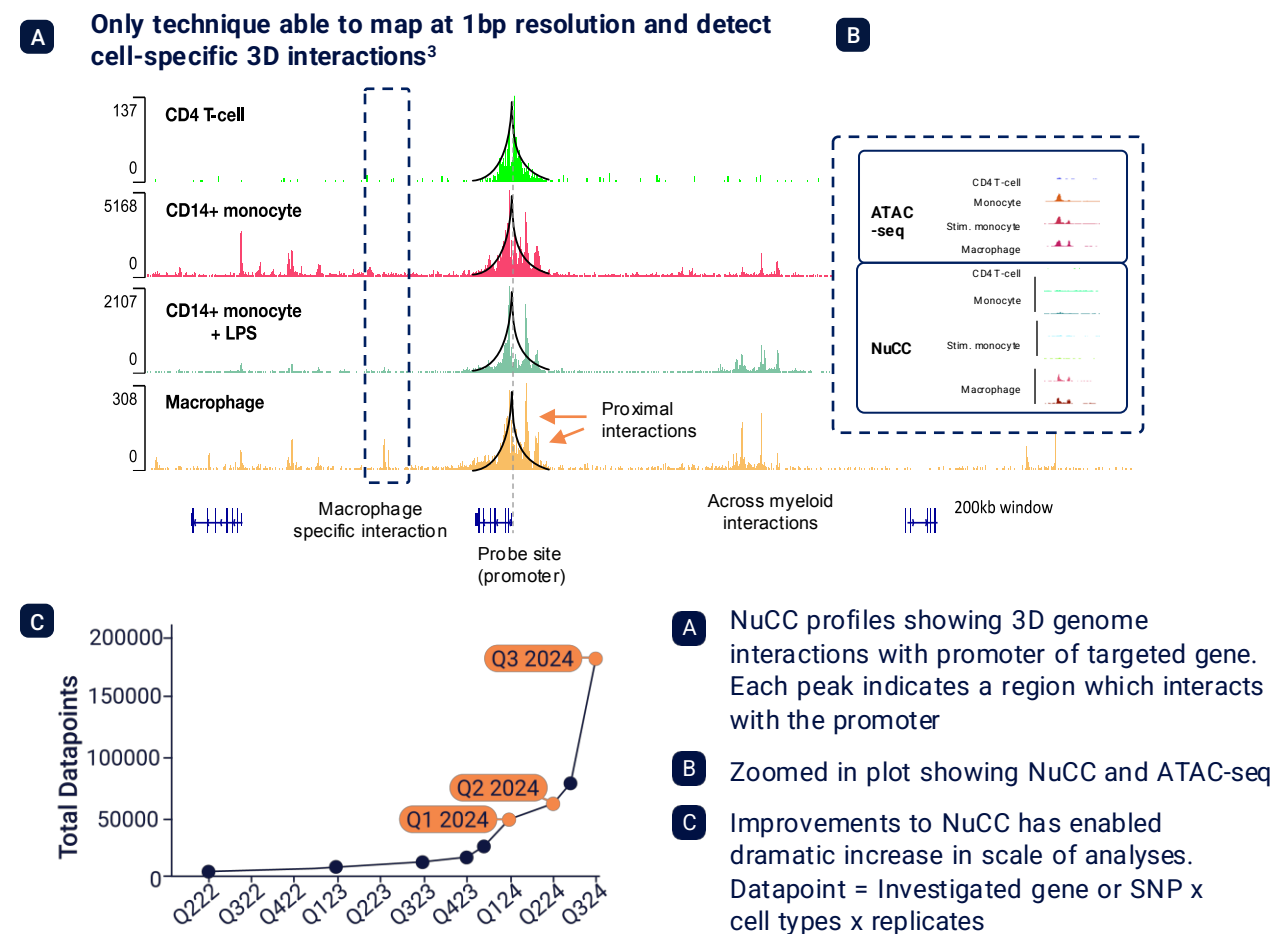

- Genetic evidence increases **clinical success x2.6<sup>1-2</sup>**
- GWAS currently has the lowest increase in clinical success, likely due to **uncertainty** around causal gene identification
- Nucleome platform designed to solve human genetic variation with **precision & scale**, discover de-risked drug targets & provide unique insights into human disease via genetics

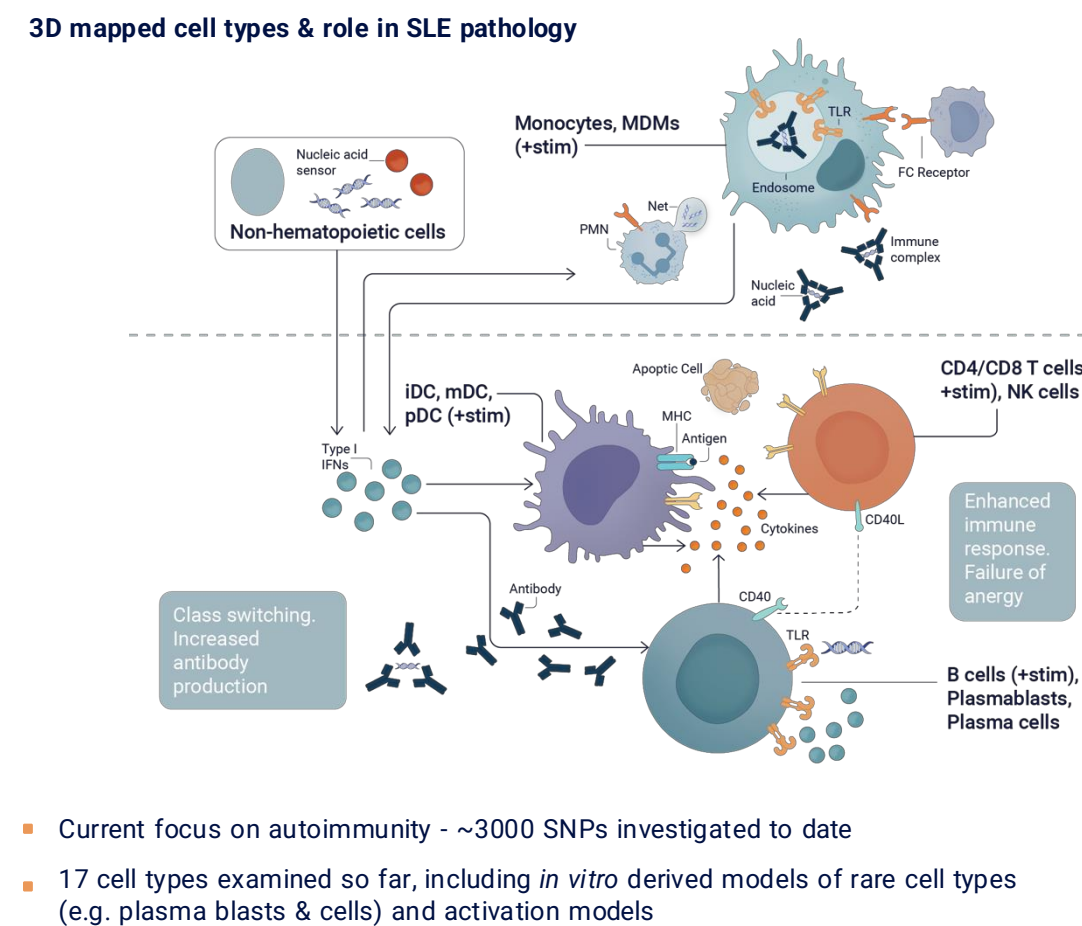

## 1 Nucleome uses principles of gene regulation to solve genetics

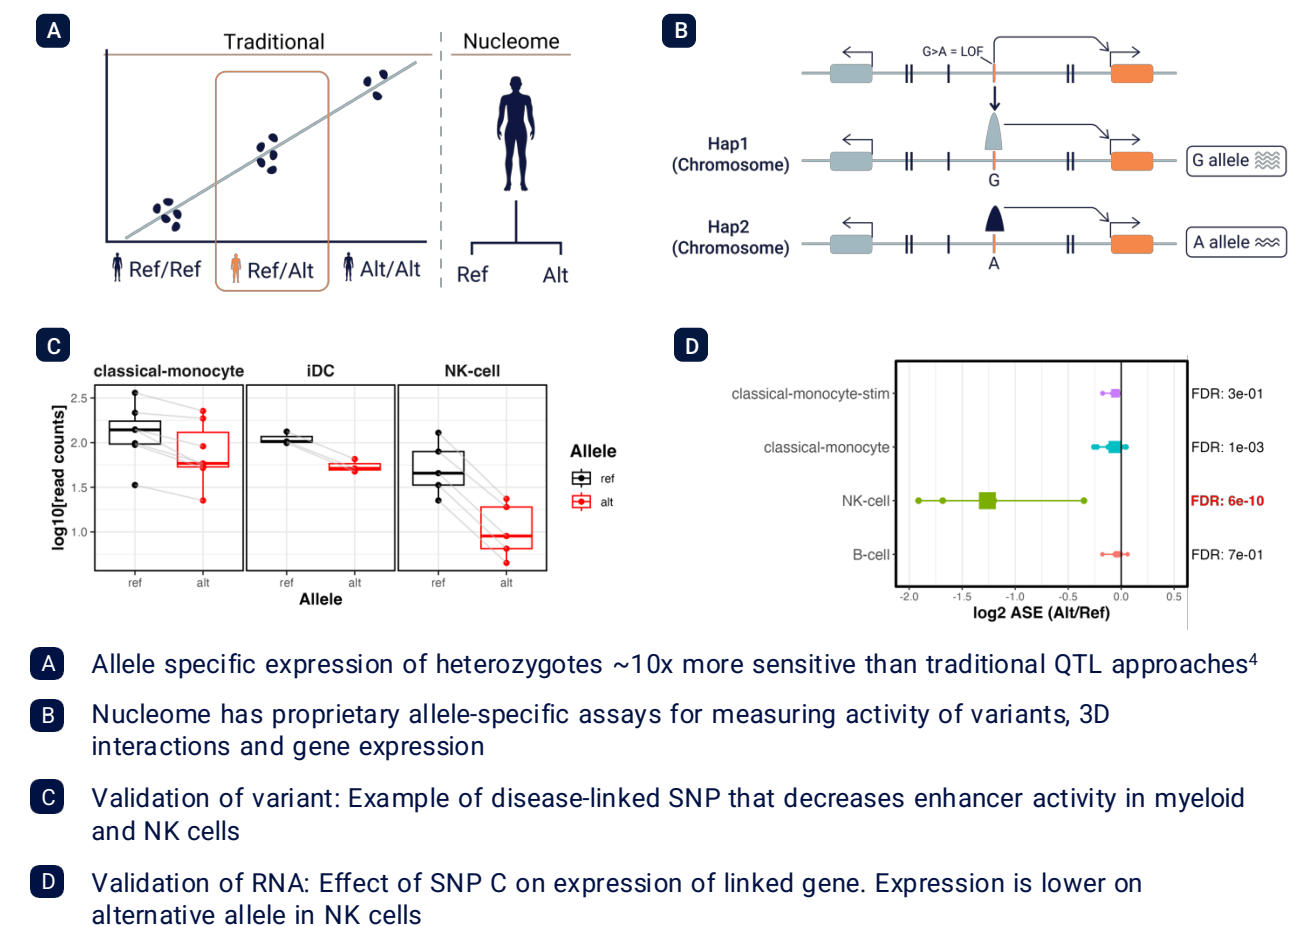

## 2 Nucleome has developed best in class 3D genome technology

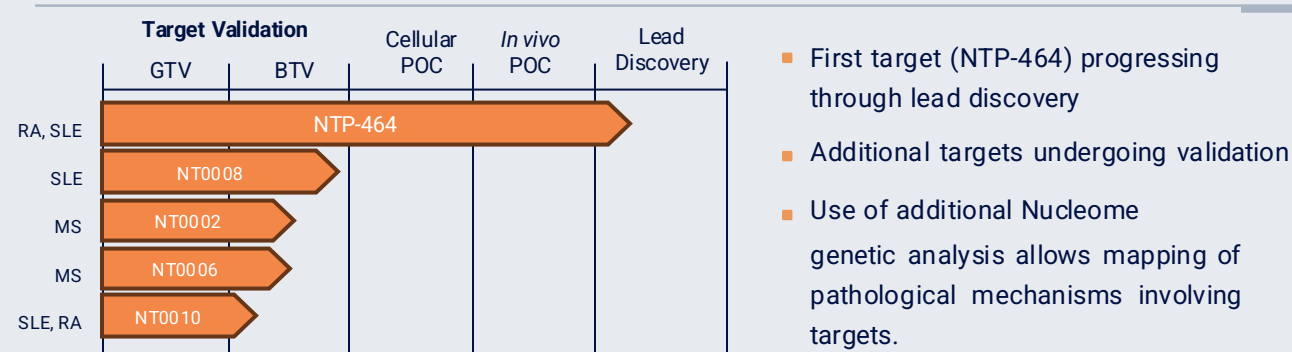

## 3 Technology applied to 1000s of autoimmune SNPs and multiple key cell types/conditions

## 4 Nucleome has developed allele specific assays for validating SNP-gene interactions

## Pipeline & outcomes

## Conclusions

- Nucleome Therapeutics uses state-of-the art gene regulation approaches to solve population genetics with **precision and scale**
- We are validating several first-in-class genetically-validated drug-targets and are advancing NTP-464 through lead-discovery
- Gene regulation is the key to understanding human disease. Nucleome platform has applications beyond target ID e.g. patient selection biomarker identification, drug repurposing and pathological mechanistic mapping
